### ***5. Can Excel be used as a programming environment?***

Excel has the ability to incorporate Microsoft's Visual Basic for applications (except Excel 2008 for Mac this feature was not available). Visual Basic is an easy to use language that allows users to create a dynamic front end, while providing for powerful yet simple manipulation of data. It can be used to connect multiple workbooks, and spreadsheets. Also because it is built into Excel it has the ability to use it's built in functions. Because of these advantages it is well suited for solving business problems.

The directions for accessing visual basic in Excel 2004 or earlier, and Excel 2011 are the same as on a PC. However, if you have Excel 2008 support for visual basic **was removed**, there you will need to use the lab Windows PC computers or acquire a copy latest Excel 2011.

The Analysis Tool Pack and Solver were removed from Mac Office 2008 because it relies on Visual Basic. Therefore, Excel 2008 for the Mac is not recommended for TIM-125/225, due to lack of Visual Basic functionality.

In Excel 2011 for Mac, it was added back. You will need Service Pack 1 for Excel 2011.

Therefore, to use these functions you will need to:

1. Use the lab computers at UCSC or
2. Acquire a copy the latest Excel 2011 and install Service Pack 1.
